

Can't actually implement a code snippet and grab output from my compiler right now as I am running into Syntax expression handling errors but here is an example of an ideal output AST.

C- example code input

```
int arr[3];
```

```
int i;
```

```
arr[0] = 10;
```

```
arr[1] = 20;
```

```
i = arr[0] + arr[1];
```

```
print(i);
```

Expected AST

Program
