

Activity 5 Guide: Spring Security Configuration

- Take a screenshot of the running application at this point.
- Paste the image into a Microsoft Word document.
- Put a caption below the image explaining what is being demonstrated.

ID	Date	Customer ID	Notes	Actions
1	01-Jan-2024	1	Customer requested a fast delivery.	Edit Delete
3	03-Jan-2024	3	This is for a birthday. Special message included.	Edit Delete
4	05-Jan-2024	4	Specific delivery time for after 5 pm	Edit Delete
5	05-Jan-2024	5	Please use eco-friendly packaging.	Edit Delete
7	07-Jan-2024	2	Customer requested an expedited shipping.	Edit Delete
12	12-Jan-2024	2	Customer requested a return label.	Edit Delete
15	15-Jan-2024	5	Customer requested a price match.	Edit Delete
16	16-Jan-2024	1	Customer wanted to track the shipment.	Edit Delete
18	18-Jan-2024	3	Customer requested an extended warranty.	Edit Delete
19	28-Oct-2025	24	fortnite	Edit Delete

After attempting login with user: hello pw: hello able to delete -> successful login.

- Take a screenshot of the running application at this point.
- Paste the image into a Microsoft Word document.
- Put a caption below the image explaining what is being demonstrated.

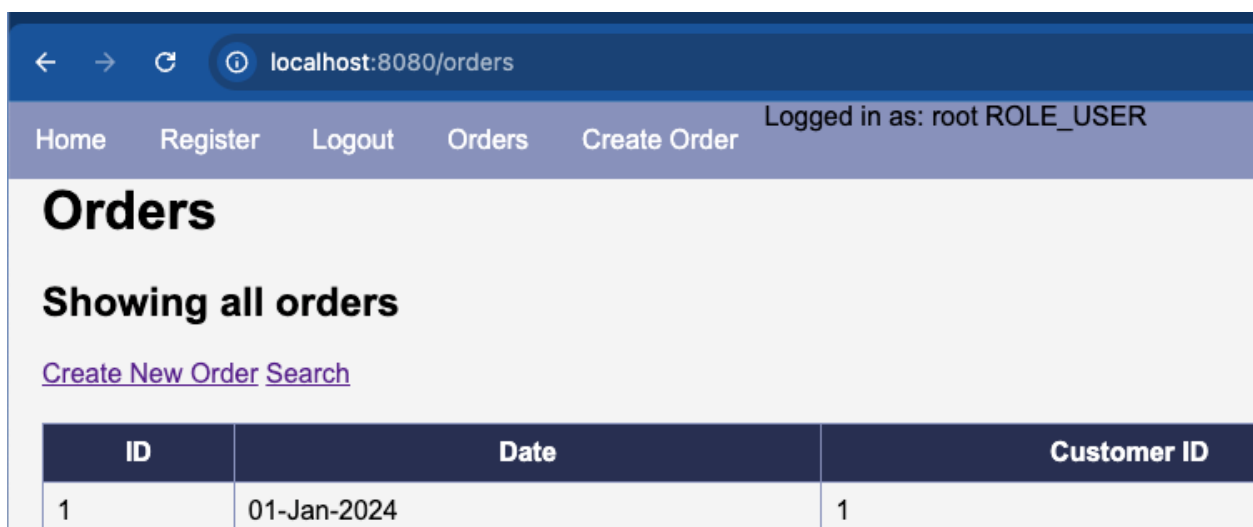

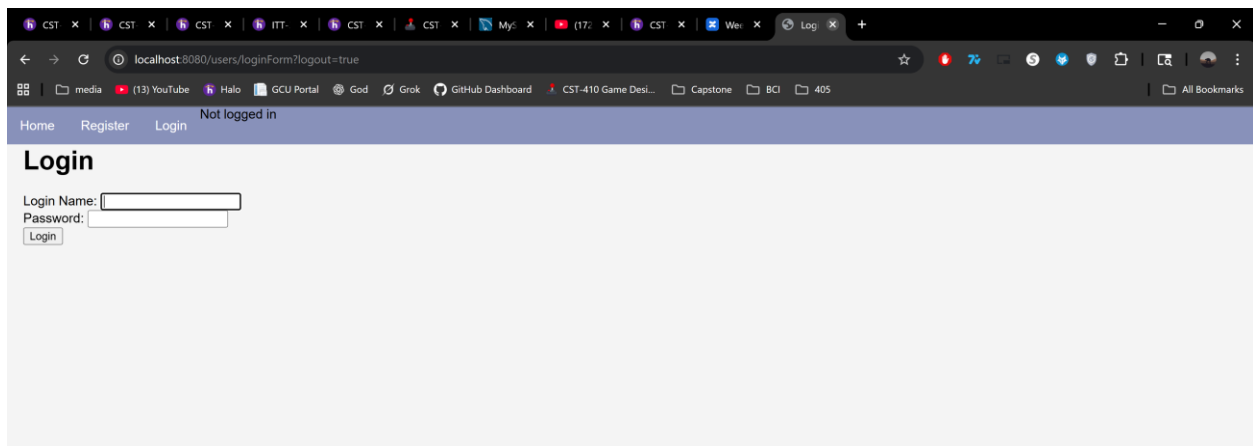

Figure 1 Links in the navbar are visible when a user is logged in.

- Take a screenshot of the running application at this point.
- Paste the image into a Microsoft Word document.

In the Spring Security framework, the fundamental elements are `SecurityFilterChain`, which enforces the access control of the requests, `AuthenticationManager` which takes care of the whole process of user logging in, and `UserDetailsService` which provides user information. `PasswordEncoder` is also an important class, it uses hashing to protect the user's passwords by changing them to an unreadable format. All the classes work together to make sure that the users can get logged in safely and can access and see only the resources that they are supposed to.

Spring Security security filter chain is like a series of filters that analyze the incoming requests with a microscope before they are directed to the controller. In order for a request to reach the controller method it needs to be allowed by one of the filters. Otherwise, for example, if the authentication filter fails the request might be dropped or sent to the login page.
